SUMMARY

A web developer designs, builds, and maintains websites and web applications. They work on both the front-end (user interface) and back-end (server and database) using languages like HTML, CSS, JavaScript, and frameworks such as React, Angular, or Node.js. Web developers ensure websites are visually appealing, responsive, and functional, focusing on performance, security, and user experience. They stay updated with industry trends and collaborate with designers, project managers, and clients to create high-quality web solutions.

SKILLS

Html.CSS.Javascript

PROJECTS

Amazon Clone

Creating an Amazon clone website using HTML and CSS involves designing a visually appealing and responsive interface that mimics Amazon's layout. This includes structuring the HTML to create sections for the header, navigation bar, product listings, and footer, while utilizing CSS to style these elements with appropriate colors, fonts, and spacing to enhance user experience.

Stopwatch

Creating a stopwatch using HTML, CSS, and JavaScript involves building a user interface with HTML, styling it with CSS, and implementing the stopwatch functionality with JavaScript. The HTML structure includes buttons to start, stop, and reset the stopwatch, and a display area to show the elapsed time. CSS is used to style the buttons and display area for a polished look. JavaScript handles the timing logic, using functions to start, stop, and reset the timer, and updating the display at regular intervals to show the current elapsed time.

Tic Tac Toe Game

Creating a Tic Tac Toe game using HTML, CSS, and JavaScript involves designing a simple user interface with a 3x3 grid. HTML structures the game board and elements, CSS styles the grid and game pieces, and JavaScript handles the game logic, including player turns, win conditions, and resetting the game. This project is a great way to practice front-end development skills and learn about interactive web applications.
